

Non-Technical Report

1. Introduction

CMSVS is a document validation and information extraction project designed to make document checking easier, faster, and more accurate. In many situations, people need to read documents carefully and compare important details manually. This process can be slow, repetitive, and prone to error, especially when documents are lengthy or contain a large amount of information.

The purpose of CMSVS is to simplify this work by helping users automatically identify important information from documents and compare it in a clear and organized manner.

2. Objective of the Project

The main objective of this project is to reduce manual effort in document analysis and comparison. Instead of requiring users to examine every page themselves, the system assists by reading the document, locating relevant information, and presenting the results in a structured format.

This project was developed to support tasks such as:

- extracting important details from a single document,
- comparing two documents to check whether their contents match,
- and making the overall validation process easier for users.

3. Overview of the Project

CMSVS works as a smart document-checking system. It accepts uploaded documents, studies their contents, and identifies the key information that the user needs. Once the information is extracted, the system can either show the results for one document or compare the extracted values from two documents.

In simple terms, the project helps transform raw documents into understandable and useful outputs. Rather than going through each page manually, users can quickly view the important details and identify any differences between files.

4. Working Process

The workflow of CMSVS is designed to be simple and user-friendly.

1. The user uploads one or two documents into the system.
2. The system reads and processes the uploaded files.
3. It identifies the important pieces of information from the document content.
4. The extracted information is arranged into a structured output.
5. If two documents are provided, the system compares the extracted values.
6. The final result is shown as a clear report for the user.

This process allows users to understand document contents more quickly and with less manual effort.

5. Main Features

CMSVS provides several useful features for general users:

- extraction of important information from a single document,
- comparison of two documents for validation,
- support for both PDFs and images,
- simple presentation of results through a web interface,
- and flexibility to work with different document types.

These features make the system practical, accessible, and easy to understand even for users without technical knowledge.

6. Importance and Impact

The project is important because document validation is a common need in many areas. People often need to check whether two documents contain the same information or whether the values in a document are correct. Doing this manually can take a lot of time and concentration.

CMSVS improves this process by reducing repetitive work and presenting the results more clearly. It saves time, improves consistency, and helps users focus on decision-making rather than spending effort on basic checking. As a result, the project has both academic value and practical usefulness.

7. Development Approach

The project was carried out in a structured and problem-focused way. The team first identified the challenge of manual document checking and then built a solution around that need. The work focused on creating a complete flow, starting from document upload and ending with result presentation.

The overall process followed in the project included:

- understanding the problem,
- planning a clear document-processing workflow,
- building extraction and comparison functions,
- designing an interface for user interaction,
- and presenting the output in a meaningful form.

This approach helped in developing a system that is not only functional but also easy to demonstrate and explain.

8. Conclusion

CMSVS is a practical and meaningful project that helps users read, analyze, and compare documents more efficiently. Its main strength lies in simplifying a task that is usually time-consuming and repetitive. By extracting key information and comparing document contents automatically, the system makes the validation process clearer and more convenient.

Overall, the project demonstrates how technology can be used to improve document handling in a way that is understandable, useful, and relevant for real-world needs.
